Table 1: Model comparison

Model	Algorithm	Periods	lppd	p_WAIC	WAIC	Log predictive score
built	VarNormalWishart	89	−494.34	24.81	1038.29	—

WAIC = −2 (lppd − p_WAIC), smaller is better; the log predictive score sums the log predictive density of the held-out periods, larger is better. ⋆: the smallest WAIC.

Table 2: Posterior inclusion probabilities: lagged endogenous variables

	invest(-1)	income(-1)	cons(-1)	invest(-2)	income(-2)	cons(-2)
invest	0.36	0.44	0.48	0.18	0.34	0.43
income	0.12	0.19	**0.79**	0.05	0.13	0.26
cons	0.03	**0.91**	**0.79**	0.06	**0.98**	0.16

Bayesian variable selection (Korobilis 2013), prior inclusion probability 0.5, 20000 draws. Bold: at least one half, the median probability model. Grey: not subject to selection.

Table 3: Posterior inclusion probabilities: deterministic terms

	constant
invest	1
income	1
cons	1

Bayesian variable selection (Korobilis 2013), prior inclusion probability 0.5, 20000 draws. Bold: at least one half, the median probability model. Grey: not subject to selection.

Table 4: Connectedness table

	invest	income	cons	From others
invest	86.9	3.6	9.5	**4.4**
income	2.2	70.3	27.5	**9.9**
cons	6.1	28.5	65.4	**11.5**
To others	**2.8**	**10.7**	**12.3**	**25.8**

Row j, column k: the share of the forecast error variance of j due to shocks to k, in percent. From others: what each variable receives; to others: what it transmits; the corner is the total spillover index, 25.7 (90% interval 18.9 to 33.3). Generalised (Diebold and Yilmaz 2012), H = 10, posterior mean over 4000 draws.

Table 5: Net pairwise spillovers

	invest	income	cons
invest	–	−0.48	−1.13
income	0.48	–	0.34
cons	1.13	−0.34	–

Row j, column k: what k transmits to j less what j transmits to k, in percent. Generalised (Diebold and Yilmaz 2012), H = 10, posterior mean over 4000 draws.
